Abstract	P.1
Acknowledgement	P.2
Chapter 1. Introduction	P.3
1.1. Laser processing around the globe	P.3
1.2. Nd:YAG and CO₂ lasers	P.4
1.3 Objectives of this research	P.6
Chapter 2. Introduction to laser processing and literature review	P.9
2.1. Laser cutting	P.9
2.1.1. Primary parameters affecting the quality of cut	P.12
2.1.1.1. Laser power density	P.12
2.1.1.2. Polarisation of beam	P.14
2.1.1.3. Cutting speed	P.14
2.1.1.4. Type, orientation, and pressure of auxiliary gas	P.15
2.1.1.5. Nozzle configuration	P.17
2.1.2. Mathematical models for laser cutting	P.23
2.1.2.1. A model for 'blind' cuts (Kar's model)	P.24
2.1.2.2. A model for 'through' cuts (Steen's model)	P.30
2.2. Laser cladding	P.32
2.2.1. Parameters affecting the quality of clad layers	P.32
2.2.1.1. Type of laser used	P.32
2.2.1.2. Method of deposition of clad powder onto the substrate before laser treatment	P.33
2.2.1.2.1. Points to note in pre-placing clad powder onto the substrate	P.34
2.2.1.2.2. Points to note in simultaneous injection of powder	P.36
2.2.1.2.3. Coaxial configuration for simultaneous injection of powder	P.36
2.2.1.2.4. Off-axial configuration for simultaneous injection of powder	P.43

2.2.1.2.4.1. Effects of shielding gas velocity and focal positions	P.45
2.2.1.2.4.2. Effects of scan speed	P.46
2.2.1.2.4.3. Effects of the angle between an off-axial nozzle and a laser head	P.47
2.2.1.2.4.4. Effects of the offset between a laser spot and the point of impact of powder stream	P.47
2.2.1.2.4.5. Stand-off distance	P.48
2.2.1.3. Microstructures obtained from laser cladding	P.52
2.2.1.3.1. Grain growth in the melt pool	P.52
2.2.1.3.2. Grain patterns and the governing parameters	P.56
2.2.1.4. Melt pool dynamics and its effects on laser cladding	P.59
2.3. Laser transformation hardening	P.67
2.3.1. Heat treatment using high-energy beams	P.67
2.3.1.1. Comparison of the various high-energy beams and lasers	P.69
2.3.2. Physics of the interactions between lasers and materials	P.70
2.3.2.1. Thermal interactions	P.71
2.3.2.2. Mechanical interactions	P.72
2.3.3. The solid-state temperature field induced by lasers	P.75
2.3.4. Depth of transformed zone	P.78
2.3.5. Threshold power density	P.79
2.3.6. Strengthening mechanisms of LTH and the various schemes for estimating the micro-hardness of transformed layers	P.81
2.3.7. Descriptions of the various strengthening mechanisms	P.84
2.3.7.1. Grain-size reduction	P.84
2.3.7.2. Dislocation strengthening	P.86
2.3.7.3. Solid solution strengthening	P.87
2.3.7.4. Precipitation hardening	P.87
2.3.8. Parameters affecting LTH	P.88
2.4. Laser laminated-object manufacturing	P.90

2.4.1. Introduction to conventional laminated-object manufacturing	P.91
2.4.2. Characteristics of LOM process	P.94
2.4.2.1. Advantages	P.94
2.4.2.2. Disadvantages	P.95
2.4.3. Status quo of LOM	P.95
Chapter 3. Experimental results	P.97
3.1. Laser cutting	P.97
3.1.1. Description of the three types of waveforms from the Nd:YAG laser used in this research	P.97
3.1.2. Criterion used in this research	P.100
3.1.3. Experiments conducted with the square waveform	P.102
3.1.3.1. The values of the 'Peak' as variables	P.103
3.1.3.2. Experimental results for variable 'Peak' values	P.104
3.1.3.3. The average power as variable	P.110
3.1.3.4. Experimental results for variable average power	P.111
3.1.4. Experiments conducted with the sine waveform	P.120
3.1.4.1. The values of the 'Depth' as variables	P.120
3.1.4.2. Experimental results for variable 'Depth' values	P.122
3.1.4.3. The average power as variable	P.127
3.1.4.4. Experimental results for variable average power	P.127
3.1.5. Capabilities of the square and sine waveforms in the cutting of carbon steels and stainless steels	P.136
3.1.6. Comparison of the capabilities in cutting of the three waveforms	P.141
3.1.7. Comparison of the ease of cut of different materials	P.144
3.1.8. Conclusions to the experimental results for cutting	P.147
3.2. Laser cladding	P.149
3.2.1. Brief introduction to the experiment	P.149
3.2.2. The substrate and the clad powder used in	

this research	P.150
3.2.3. Preparations before laser processing	P.153
3.2.3.1. A brief introduction to flame spraying	P.153
3.2.3.2. Preparation of samples	P.156
3.2.3.2.1. Surface cleansing	P.156
3.2.3.2.2. Surface roughening	P.157
3.2.3.2.3. Pre-heating	P.157
3.2.3.2.4. Flame-spraying	P.157
3.2.4. Equipment used in this research	P.157
3.2.5. Analyses of the clad layers	P.159
3.2.5.1. Structural analyses before and after laser treatment with X-ray diffractometry	P.159
3.2.5.2. Examination of the clad layers before and after laser treatment with a scanning electron microscope	P.161
3.2.5.3. Strengthening of the interface	P.162
3.2.6. Micro-hardness measurements	P.162
3.2.6.1. Micro-hardness profile along the depth	P.162
3.2.7. Microstructures of laser-treated clad layers	P.164
3.2.8. Relationships between (a) micro-hardness and scan speed (b) micro-hardness and power	P.165
3.2.8.1. Relationship between micro-hardness and scan speed	P.165
3.2.8.2. Relationship between micro-hardness and laser power	P.169
3.2.9. Observations during experiments	P.171
3.2.9.1. Cracking	P.171
3.2.9.2. Peeling off of the pre-placed clad layers	P.172
3.2.9.3. Under-melting and over-melting of the pre-placed clad layers	P.173
3.2.9.4. Porosity, impurity, and trapped gas	P.173
3.2.9.5. Surface roughness	P.174
3.2.10. Conclusions to the experimental results of laser cladding	P.174

3.3. Laser transformation hardening	P.176
3.3.1. Brief introduction to the experiment and the substrates	P.176
3.3.2. Typical appearance after laser irradiation	P.177
3.3.3. Micro-hardness profiles of laser-treated samples in the direction of hardened zone	P.179
3.3.4. Relationship between the average micro-hardness of laser hardened zones and scan speed	P.181
3.3.5. A 'simple' scheme for evaluation of the micro-hardness of hardened zone	P.186
3.3.6. Validation of the 'simple' scheme with three examples	P.188
3.3.7. Conclusions to the experimental results of LTH	P.195
3.4. Mould making by laser laminated-object manufacturing	P.196
3.4.1. Hardware and software of the hybrid LOM system used in this research	P.196
3.4.2. The LOM strategy used in this research	P.197
3.4.3. The workflow of the experiment	P.198
3.4.3.1. Computer-aided design with AutoCAD R13	P.198
3.4.3.1.1. Sectioning of a 3D CAD representation	P.200
3.4.3.1.2. File conversion to the DXF format	P.201
3.4.3.2. Production of laminations with an Nd:YAG laser	P.202
3.4.3.3. Binding of laminations	P.202
3.4.3.4. Surface finishing of the laminated mould by using a machining centre	P.203
3.4.3.4.1. Conversion of an AutoCAD file (DWG) to the IGES format	P.204
3.4.4. Problems encountered during production of the prototypical mould	P.205
3.4.4.1. Compatibility of software programmes used	P.205
3.4.4.2. Problem in slicing a 3D mould	P.207
3.4.4.3. Dimensional problem	P.210
3.4.4.4. Problems in surface finishing operations with the machining centre	P.211

3.4.5. Total time spent on fabrication with the machining centre	P.213
3.4.6. Conclusions to the experimental results of Laser LOM	P.213
Appendix A.	P.215
Appendix B.	P.216
Appendix C.	P.221
Appendix D.	P.223
References	P.227
